

What is Box Shadow?

Box shadow is a CSS property that allows you to add shadow effects to elements on a web page. This property allows you to specify the horizontal and vertical offset of the shadow, the blur radius, and the color of the shadow. You can also specify multiple shadows, which can be used to create more complex effects.

Syntax:

box-shadow: h-offset v-offset blur spread color;

Parameters:

- **Horizontal offset:** The distance the shadow is offset to the right of the element.
- **Vertical offset:** The distance the shadow is offset below the element.
- **Blur radius:** The amount of blur applied to the shadow.
- **Spread radius:** The amount by which the shadow is spread out.
- **Color:** The color of the shadow.

Example of Box Shadow: This example illustrates the use of the **box-shadow** property where properties such as h-offset, v-offset, blur, spread & color are applied along with their values.

```
.box { box-shadow: 10px 10px 2px 1px rgb(11, 150, 9);}
```

```
.box-2 { box-shadow: 10px -10px rgb(11, 150, 9);}
```

```
.box-3 { box-shadow: inset 5em 1em rgb(11, 150, 9);}
```

```
.box-4 {
```

```
    box-shadow: 3px 3px rgb(11, 150, 9), -1em 0 .4em rgb(184, 77, 38);}
```

Output:

box-shadow

What is Drop Shadow?

A [drop shadow](#) is a specific type of box shadow that is used to give an element the appearance of being elevated above the page or other **elements**. **drop-shadow()** is **CSS filter function** that creates a shadow that conforms to the shape

Drop shadows have offset values but no blur or spread, so they appear as a dark shape directly below/behind the element casting the shadow.

Syntax:

```
drop-shadow(<shadow>)
```

Parameters:

- **Horizontal offset:** The distance the shadow is offset to the right of the element.
- **Vertical offset:** The distance the shadow is offset below the element.
- **Blur radius:** The amount of blur applied to the shadow.
- **Color:** The color of the shadow.

Example of Drop-Shadow: This example illustrates the use of the [drop-shadow](#) property where properties such as h-offset, v-offset, blur, & color are applied along with their values.

```
.box-2 { filter: drop-shadow(0 0 0.75rem rgb(11, 150, 9));}
```

```
.box-3 { filter: drop-shadow(20px 10px 4px rgb(11, 150, 9));}
```

```
.box-4 { filter: drop-shadow(0 -6mm 4mm rgb(11, 150, 9));}
```

Output:

drop-shadow

Difference between Box Shadow and Drop Shadow

Property	box-shadow	drop-shadow
Definition	CSS property that creates a rectangular shadow around an element.	CSS filter function that creates a shadow that conforms to the shape (alpha channel) of an element.
Shadow	Can have multiple shadows defined with commas	Only a single shadow is used
Performance	Faster	Slower
Example:	Creating a rectangular shadow around an element, adding depth and dimension to a design, making an element stand out from the page.	Creating a shadow that conforms to the shape of an element, creating realistic shadows, improving accessibility.

Understanding the differences between Box Shadow and Drop Shadow can significantly impact your web design. Box Shadow is versatile and widely supported, making it great for emphasizing elements and adding subtle styling. Drop Shadow, on the other hand, is perfect for creating realistic, shape-conforming shadows that follow modern design principles.
